## Decaffeination process with liquid carbon dioxide.

The green coffee grains are soaked with water

CO<sub>2</sub> with the extorted caffeine are transferred to a dehumidifier

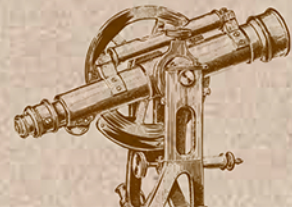

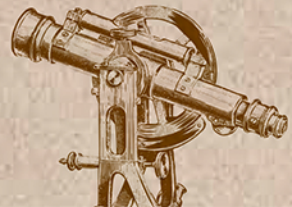

The CO<sub>2</sub> circulation stops

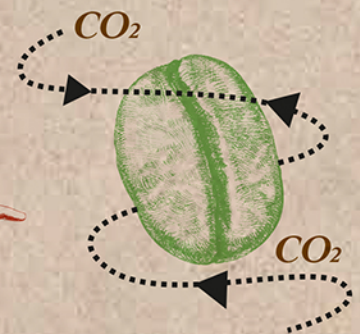

The process is repeated at the same pace until the desired decaffeination level is reached

The coffee grains are transferred to a dehumidifier and are dried to the initial wet stage

CO<sub>2</sub> circulates around the coffee grains and extorts the caffeine

They are transferred into a special container and are brought in contact with liquid CO<sub>2</sub>
